APPENDIX C SYNONYMS	C-1

1. INTRODUCTION

The Superfund Chemical Data Matrix (SCDM) Appendix B Tables are a source for factor values and benchmark values applied when evaluating potential National Priority List (NPL) sites using the Hazard Ranking System (HRS). The HRS assigns factor values for toxicity, gas migration potential, gas and ground water mobility, surface water persistence, and bioaccumulation potential based on the physical, chemical, and radiological properties of hazardous substances (defined for HRS purposes as CERCLA hazardous substances plus CERCLA pollutants and contaminants) present at a site for a particular migration pathway. The HRS also assigns extra weight to targets with exposure levels to hazardous substances that are at or above benchmarks. These benchmarks include both screening concentrations and concentrations specified in regulatory limits for the hazardous substances present at a site for a particular migration pathway.

SCDM contains HRS factor values and benchmark values for hazardous substances that are frequently found at sites evaluated using the HRS, as well as the physical, chemical, and radiological data used to calculate those values. The raw data in SCDM are either taken directly from sources or are calculated from a source. The HRS rules are then applied to the raw data to arrive at a factor value or benchmark.

Section 2 of this document explains how data are selected and calculated for inclusion in SCDM. Section 3 describes how SCDM data, HRS factor values, and benchmarks are presented. The factor values and benchmarks are listed, substance by substance, in Appendix A (not included). Appendix B-1 contains an HRS factor value and benchmark tables (organized by pathway) for nonradioactive hazardous substances, Appendix B-2 contains similar tables for radionuclides, and Appendix C contains a cross reference index of substance name synonyms.

1.1 DEFINITIONS

In addition to the definitions found in Section 1.1 of the Hazard Ranking System (55 *Federal Register* 51585 - 51587, 14 December 1990), the following definitions are used in this document:

- **Cancer Risk Screening Concentrations:** Substance-specific intake concentrations that are based on estimates of a daily exposure level of a substance. They are used in the HRS as benchmarks in evaluating target populations actually exposed to carcinogenic substances (see also the definition of “Screening Concentrations” in Section 1.1 of the HRS).
- **Reference Dose Screening Intake Benchmarks:** Substance-specific intake concentrations that are based on estimates of a daily exposure level of a substance. They are used in the HRS as benchmarks in evaluating target population actually exposed to noncarcinogenic substances (see also the definitions of “Reference Dose” and “Screening Concentrations” in Section 1.1 of the HRS).

2. SUPERFUND CHEMICAL DATA MATRIX DATA SOURCES

This Section describes how the data available in research studies and regulatory guidance documents are chosen for inclusion in SCDM. Section 2.1 describes how to resolve ambiguities in determining which particular values are included for particular hazardous substances. Section 2.2 specifies the references used as sources for SCDM data. The choices described below are based on the type and quality of data in the references listed in Section 2.2; they are not intended to apply to all data in general. As different compilations of data become available, different criteria may be considered. Finally, SCDM requires some

types of data for which extensive compilations are unavailable. Section 2.3 describes how these values were calculated from other types of data that were available.

2.1 HAZARDOUS SUBSTANCE IDENTITIES

Compiling SCDM requires determining which data reasonably apply to a hazardous substance. Data in the references cited in Section 2.2 are sometimes available for classes and mixtures of hazardous substances but not for the individual substances in that class or mixture. This Section describes how ambiguities in assigning particular values to members of classes or mixtures of hazardous substances in SCDM have been resolved.

SCDM contains generic values for the following classes of compounds (for chromium, these generic values are used only when specific oxidation state is not adequately known):

- Chromium (III and VI oxidation states)
- Arsenic (III and V oxidation states)
- PCBs (various congeners and Aroclors)
- Endosulfans (I and II)

If any member of these classes can be documented as present at a hazardous substance site, it is assumed that the most toxic, most persistent, or most bioaccumulating member of the class is present (unless the oxidation state of chromium is adequately known). Therefore, from among the data given in the specified references for members of these classes, SCDM contains those data resulting in the greatest HRS factor values (*e.g.*, lowest LD₅₀, longest half-life, greatest bioconcentration factor). In the case of endosulfans I and II (which can be distinguished analytically), no data for either isomer by itself are available in the designated sources; all available data were thus obtained using the mixture of endosulfan isomers.

For the following classes of compounds, SCDM contains values for individual substances:

- Dichlorobenzenes
- Dichloroethylenes
- Dinitrotoluenes
- Hexachlorocyclohexanes
- Nitrophenols
- Xylenes

If no data can be found in the specified references for a specific substance in the class but data are available for the generic class, SCDM assigns the generic value to that substance. These classes are all relatively small sets of isomers, which are likely to occur as mixtures in many cases. Furthermore, these classes are well defined in the sense that the generic class, *e.g.*, xylenes, almost always refers to a mixture of all members of the class (*o*-, *m*-, and *p*-xylene in the example). The expected similarity in chemical behavior for members of each class, as well as the likelihood that they will occur as mixtures, makes use of data from mixtures reasonable.

In contrast, if data are not available in the specified references for a substance in the following classes, generic properties are not ascribed in SCDM to the specific substances:

- chlorinated naphthalenes
- chlorobenzenes

The reason for the different treatment of these two classes compared to the classes previously cited is that they are larger than the other classes. In addition, they are less well defined in the sense that the generic class, *e.g.*, chlorinated naphthalenes, does not always refer to a similar mixture (chlorinated naphthalenes may be predominantly mono- and dichloronaphthalenes in some cases and tetra- and

pentachloronaphthalenes in other cases). As a result, it is likely that some members of these classes will occur without the members of the class that give rise to the particular value; for example, it seems unreasonable to assign a value for chlorinated naphthalenes to 2-chloronaphthalene if tri- or tetrachloronaphthalene isomers dominate the measurement of that value, whereas tri- and tetrachloronaphthalenes are not necessarily present when 2-chloronaphthalene is found.

SCDM also defines another class of compounds containing the following polychlorinated dibenzodioxins and polychlorinated dibenzofurans:

- 2,3,7,8-Tetrachlorodibenzo-*p*-dioxin
- 1,2,3,7,8-Pentachlorinated dibenzo-*p*-dioxin
- 1,2,3,4,7,8-Hexachlorinated dibenzo-*p*-dioxin
- 1,2,3,7,8,9-Hexachlorinated dibenzo-*p*-dioxin
- 1,2,3,6,7,8-Hexachlorinated dibenzo-*p*-dioxin
- 1,2,3,4,6,7,8-Heptachlorinated dibenzo-*p*-dioxin
- 2,3,7,8-Tetrachlorodibenzofuran
- 1,2,3,7,8-Pentachlorinated dibenzofuran
- 2,3,4,7,8-Pentachlorinated dibenzofuran
- 1,2,3,4,7,8-Hexachlorinated dibenzofuran
- 1,2,3,7,8,9-Hexachlorinated dibenzofuran
- 1,2,3,6,7,8-Hexachlorinated dibenzofuran
- 2,3,4,6,7,8-Hexachlorinated dibenzofuran
- 1,2,3,4,6,7,8-Heptachlorinated dibenzofuran
- 1,2,3,4,6,7,9-Heptachlorinated dibenzofuran

SCDM contains for individual members of this class. SCDM estimates the cancer slope factor for all members of this class except 2,3,7,8-tetrachlorodibenzo-*p*-dioxin (TCDD). The cancer slope for TCDD is multiplied by the *toxicity equivalence factor* (TEF) for each substance to give the estimated slope factor for that substance. TEF values are obtained from Table 3 of USEPA (1989a), on page 12. All members of this class are assigned the weight-of-evidence for TCDD.

For all data except toxicity, if nothing can be found in the specified references for an individual chemical and data are available for the generic class or for TCDD, SCDM assigns the generic or TCDD value to the substance (*not multiplied by the TEF*). This is a relatively small class of congeners, which is often likely to occur in mixtures. Furthermore, the expected similarity in chemical behavior for a set of tetra- through heptachlorinated polynuclear heteraromatic substances (all of which have one or more elements of molecular symmetry present), as well as their likelihood to occur in mixtures, makes use of data from mixtures or TCDD reasonable.

2.2 DATA COMPILATION METHODOLOGY

2.2.1 Toxicity Information

2.2.1.1 LD₅₀—Oral, Dermal

SCDM uses data from the following references for oral and dermal LD₅₀:

- C-E Environmental, Inc., 1990, *The Identification of Health Effects Data for Chemicals Contained in the Clean Air Act Amendments: Final Report to Dr. John Vanderburg*, U. S. Environmental Protection Agency, Research Triangle Park, NC.

- American Conference of Governmental Industrial Hygienists (ACGIH), 1986, *Documentation of the Threshold Limit Value and Biological Exposure Indices*, 5th ed., ACGIH, Cincinnati, OH.
- National Institute for Occupational Safety and Health (NIOSH), 1993, *Registry of Toxic Effects of Chemical Substances (RTECS)*, NIOSH Publication #83-107, NIOSH, Cincinnati, OH.

SCDM prefers C-E Environmental data over the other two sources, and prefers ACGIH over NIOSH data.

SCDM contains the lowest value for any mammalian species by the specified route of exposure (*i.e.*, oral or dermal) in controlled dose studies in laboratory animals. Human lethality data (*i.e.*, from suicide and worker poisonings) are not used due to the associated inaccuracy of the dosage estimates. Data from former East Block countries (*e.g.*, USSR) are not used due to the typically poor data quality. Only data for exposure durations less than 24 hours are used. If an LD₅₀ value is not given, SCDM uses an LD_{LO} value under three conditions: (1) if it is for the same exposure route, (2) has an exposure less than 24 hours, and (3) is reasonable relative to the other values (*e.g.*, relative to chronic values) given for that substance and exposure route.

2.2.1.2 LC₅₀—Inhalation

SCDM uses data from the following references for inhalation LC₅₀:

- American Conference of Governmental Industrial Hygienists (ACGIH), 1986, *Documentation of the Threshold Limit Value and Biological Exposure Indices*, 5th ed., ACGIH, Cincinnati, OH.
- National Institute for Occupational Safety and Health (NIOSH), 1993, *Registry of Toxic Effects of Chemical Substances (RTECS)*, NIOSH Publication #83-107, NIOSH, Cincinnati, OH.

SCDM prefers ACGIH data over NIOSH data.

SCDM contains the lowest value for any mammalian species by inhalation in controlled dose studies in laboratory animals. Human lethality data (*i.e.*, from suicide and worker poisonings) are not used due to the associated inaccuracy of the dosage estimations. Data from former East Block countries (*e.g.*, USSR) are not used due to the typically poor data quality. Only data for exposure durations less than 24 hours are used. If an LC₅₀ value is not given, SCDM uses an LC_{LO} value under three conditions: (1) if it is for the same exposure route, (2) has an exposure less than 24 hours, and (3) is reasonable relative to the other values (*e.g.*, relative to chronic values) given for that substance and exposure route.

2.2.1.3 Reference Dose (RfD)—Oral, Inhalation

SCDM uses data from the following references for oral and inhalation RfD:

- U. S. Environmental Protection Agency, 1993, Integrated Risk Information System (IRIS) database (updated monthly).
- U. S. Environmental Protection Agency, 1993, *Health Effects Assessment Summary Tables (HEAST), FY 1993 Annual Update*, Office of Solid Waste and Emergency Response (OHEA ECAO-821).

SCDM prefers IRIS data over HEAST data. Inhalation data in IRIS are given as RfCs—the reference concentrations equivalent to dose—rather than RfDs. Reference concentrations are converted to doses by the following equation:

$$RfD_{inhal} = \frac{RfC \times IR \times AR}{BW \times 100} \quad [1]$$

where:

RfC = Reference Concentration in Air (mg/m^3)

IR = Inhalation Rate (m^3/day)

BW = Body Weight (kg)

AR = Absorption Rate (in percent)

Using an inhalation rate of $20 \text{ m}^3/\text{day}$ and an average adult body weight of 70 kg in equation [1] provides the following expression:

$$RfD_{inhal} = \frac{RfC \times AR}{350} \quad [2]$$

Equation [2] is used to convert reference concentrations to reference doses for use in SCDM. If USEPA does not provide an absorption rate, it is assumed to be 100 percent; this is consistent with the conversion described in HEAST.

2.2.2 Carcinogenicity Information

2.2.2.1 Cancer Potency Factor and Weight-of-Evidence—Oral, Inhalation

SCDM uses data from the following references for oral and inhalation cancer potency factors and the associated weights-of-evidence:

- U. S. Environmental Protection Agency, 1993, Integrated Risk Information System (IRIS) database (updated monthly).
- U. S. Environmental Protection Agency, 1993, *Health Effects Assessment Summary Tables (HEAST), FY 1993 Annual Update*, Office of Solid Waste and Emergency Response (OHEA-ECAO-CINN-821).

SCDM prefers IRIS values for nonradioactive hazardous substances over HEAST values. For radioactive hazardous substances, SCDM contains values from HEAST. The data in IRIS for inhalation are given as unit cancer risks, which are related to cancer potency factors by the following equation (used for nonradionuclides only):

$$UCR = \frac{IR \times AR \times CPF_{inhal}}{BW \times CF \times 100} \quad [3]$$

where:

UCR = Unit Cancer Risk ($\text{m}^3/\mu\text{g}$)

IR = Inhalation Rate (m^3/day)

CPF = Cancer Potency Factor ($\text{kg-day}/\text{mg}$)

BW = Body Weight (kg)
AR = Absorption Rate (in percent)
CF = Conversion Factor (1,000 µg/mg)

Using an inhalation rate of 20 m³/day and an average adult body weight of 70 kg, solving equation [3] for CPF provides the following expression:

$$CPF_{inhale} (\text{kg-day/mg}) = \frac{UCR \times 350,000}{AR} \quad [4]$$

Equation [4] is used to convert unit cancer risk values to cancer potency factors for use in SCDM. If IRIS does not provide an absorption rate, it is assumed to be 100 percent; this is consistent with the conversion described in HEAST.

SCDM uses the weight-of-evidence from the same reference that provides the corresponding slope factor. Typically, IRIS reports a single weight-of-evidence; this value is recorded separately as both the oral weight-of-evidence and inhalation weight-of-evidence. In HEAST, there are usually two values listed, one for oral and one for inhalation. Usually these values are identical; SCDM records each value separately.

2.2.2.2 ED₁₀ and Weight-of-Evidence—Oral, Inhalation

SCDM uses data from the following reference for oral and inhalation ED₁₀:

- U. S. Environmental Protection Agency, 1988, *Methodology for Evaluating Potential Carcinogenicity in Support of Reportable Quantity Adjustments Pursuant to CERCLA Section 102*, Office of Health and Environmental Assessment (EPA/600/8-89/053).

In USEPA (1988), a single potency factor (1/ED₁₀) is reported. The reciprocal of this value is recorded separately as both the oral ED₁₀ and inhalation ED₁₀. Typically, these values are identical; SCDM records each value separately. SCDM uses the weight-of-evidence from the same reference that provides the corresponding ED₁₀ value. The potency factor for chromium is taken from the Reportable Quantity Adjustments document (EPA/600/8-91/093).

2.2.3 Mobility Information

2.2.3.1 Vapor Pressure

SCDM uses data from the following references for vapor pressure:

- U. S. Environmental Protection Agency, 1989b, *Risk Assessment Guidance for Superfund [RAGS] Appendices, Superfund Public Health Evaluation Manual*, Exhibit A-1: Physical, Chemical and Fate Data, Office of Emergency and Remedial Response (ECAO-CIN-745).
- Syracuse Research Corporation (SRC), 1993, CHEMFATE database.
- GSC Corporation, 1990, CHEMEST database, developed for USEPA Office of Pesticides and Toxic Substances.

SCDM prefers RAGS data over CHEMFATE and CHEMEST. Within CHEMFATE, the recommended value is preferred. If a recommended value is not available, SCDM uses a value measured at 25°C. If values are not available for measurements at 25°C, values determined within the range of 20-30°C are used. If there is more than one value measured at the same temperature and none is recommended, SCDM uses the highest value. If no conditions (e.g., temperature) were specified in CHEMFATE for all vapor pressure measurements for a substance, SCDM uses the highest value. For organic substances, if CHEMFATE contains only a reference citation without a value, CHEMEST is used to estimate values. For non-metallic substances, if no vapor pressure is available a normal boiling point was obtained from Weast (1981). The following substances had no vapor pressure values available and normal boiling points less than 25°C:

- chlorine cyanide
- cyanogen
- fluorine
- hydrogen sulfide
- nitrogen dioxide
- phosphine
- radon-222

These substances were assigned a default vapor pressure of 760 torr (*i.e.*, they are assumed for HRS purposes to be gases at 25°C).

If no vapor pressure is available for a substance and the normal boiling point is greater than or equal to 25°C, SCDM assumes for HRS purposes that the substance is a particulate, rather than a gaseous substance, although no default vapor pressure value is assigned in SCDM. This assumption is made because for non-gaseous substances (under standard conditions), the absence of vapor pressure value is very often because the value is extremely low and can not be measured.

2.2.3.2 Henry's Law Constant

SCDM uses data from the following references for Henry's Law constant:

- U. S. Environmental Protection Agency, 1989b, *Risk Assessment Guidance for Superfund [RAGS] Appendices, Superfund Public Health Evaluation Manual*, Exhibit A-1: Physical, Chemical and Fate Data, Office of Emergency and Remedial Response (ECAO-CIN-745).
- Syracuse Research Corporation, 1993, CHEMFATE database.
- GSC Corporation, 1990, CHEMEST database, developed for USEPA, Office of Pesticides and Toxic Substances.

SCDM prefers RAGS data over CHEMFATE and CHEMEST. Within CHEMFATE, a recommended value is preferred. If a recommended value is not available, SCDM uses a value measured at 25°C. If values are not available for measurements at 25°C, values determined within the range of 20-30°C are used. If there is more than one value measured at the same temperature and none is recommended, SCDM uses the highest value. If no conditions (e.g., temperature) were specified in CHEMFATE for all Henry's law constant measurements for a substance, SCDM uses the highest value. For organic substances, if CHEMFATE contains only a reference citation without a value, CHEMEST is used to estimate values. CHEMEST is also used to calculate a numerical value for organic substances if the other references report a value as miscible or infinitely soluble.

2.2.3.3 Water Solubility—Non-metallic Compounds

SCDM uses data from the following references for water solubility for non-metallic compounds:

- U. S. Environmental Protection Agency, 1989b, *Risk Assessment Guidance for Superfund [RAGS] Appendices, Superfund Public Health Evaluation Manual*, Exhibit A-1: Physical, Chemical and Fate Data, Office of Emergency and Remedial Response (ECAO-CIN-745).
- Syracuse Research Corporation, 1990, CHEMFATE database.
- GSC Corporation, 1990, CHEMEST database, developed for USEPA, Office of Pesticides and Toxic Substances.

SCDM prefers RAGS data over CHEMFATE and CHEMEST. Within CHEMFATE, the recommended value is preferred. If a recommended value is not available, SCDM uses a value measured at 25°C. If values are not available for measurements at 25°C, values determined within the range of 20-30°C are used. If there is more than one value measured at the same temperature and none is recommended, SCDM uses the highest value. If no conditions were specified in CHEMFATE for any measurement for a substance, SCDM uses the highest value. For organic substances, if CHEMFATE contains only a reference citation without a value, CHEMEST is used to estimate values. CHEMEST is also used to calculate a numerical value for organic substances if the other references report a value as miscible or infinitely soluble.

2.2.3.4 Water Solubility—Metals and Metalloids

SCDM uses data from the following references for water solubility of metals and metalloid compounds:

- Weast, R.C., 1981, *Handbook of Chemistry and Physics*, 62nd ed., Cleveland, OH: CRC Press, pp. B-73 - B-166.
- Dean, J. A., Ed., 1985, *Lange's Handbook of Chemistry*, 13th ed., New York: McGraw-Hill, pp. 5-7 - 5-12.

SCDM contains geometric mean water solubility values which are defined in the HRS as the geometric mean of the highest and the lowest water solubility values available for any compound containing the metal or metalloid. Highest and lowest compound solubility values were taken directly from Weast (1981), except for the following low solubility compounds:

- | | |
|---|--|
| <ul style="list-style-type: none">• Copper (II) sulfide• Lead (II) sulfide• Mercury (II) sulfide• Nickel (II) sulfide• Silver (I) sulfide | <ul style="list-style-type: none">• Thallium (III) hydroxide• Thorium (IV) hydroxide• Uranyl hydroxide• Zinc (II) sulfide |
|---|--|

Solubility values for these compounds were calculated using the standard expression for the solubility product (K_{sp}) for each compound and the K_{sp} value taken from Dean (1985).

2.2.3.5 Distribution Coefficient (K_d)

SCDM uses data from the following reference for distribution coefficient:

- CH₂M Hill, 1990, *Revised K_d and Water Solubility Values to Support Ground Water Mobility Scoring*, memorandum no. WDC61607.A0.01 from P. Chapman to A Ortiz, USEPA, et al.

For organic hazardous substances, SCDM contains the geometric mean K_d value presented in the reference (geometric mean of the K_d high [0.77• K_{oc}] and K_d low [0.03• K_{oc}]). For some organic substances for which CH₂M Hill (1990) provides no K_d value and which have a partition coefficient value chosen as described in Section 2.2.5.2, a K_d value is calculated as specified in Section 2.3.2. For any hazardous substance that is a metal or metalloid, the HRS requires assigning the distribution coefficient for the metal or metalloid. For an inorganic hazardous substance, CH₂M Hill (1990) reports a single K_d value taken from Baes *et al.* (1984).

2.2.4 Persistence Information

2.2.4.1 Hydrolysis, Biodegradation, and Photolysis Half-Lives

SCDM uses data from the following references for hydrolysis, biodegradation, and photolysis half-lives:

- Syracuse Research Corporation (SRC), 1989, *Chemical Fate Rate Constants for SARA Section 313 Chemicals and Superfund Public Health Evaluation Manual (SPHEM) Chemicals*, prepared under contract no. 68-02-4254 for USEPA Office of Toxic Substances and USEPA Environmental Criteria and Assessment Office.
- Syracuse Research Corporation, 1993, CHEMFATE database.
- National Institute for Occupational Safety and Health (NIOSH), 1983, *Registry of Toxic Effects of Chemical Substances (RTECS)*, NIOSH Publication #83-107, NIOSH, Cincinnati, OH.

SCDM contains values from the SRC (1989) in preference to CHEMFATE, which is used in preference to data from NIOSH (1983). SCDM contains values measured at 25°C; if no values for measurements at 25°C are available, values determined within the range of 20-30°C are used. In SRC (1989) high and low values are given for hydrolysis, biodegradation and photolysis. The high value is used for these three parameters. SCDM also includes values from NIOSH (1983) where no conditions are specified or where “scientific judgment” is given as the only rationale for inclusion. Measurements performed in non-aqueous solvents from any reference and data qualified by CHEMFATE as “insufficient” are omitted.

2.2.4.2 Radioactive Half-Life

SCDM uses data from the following reference for radioactive half-life:

- International Commission on Radiological Protection (ICRP), *Radionuclide Transformations: Energy and Intensity of Emissions*, Publication No. 38.

2.2.5 Bioaccumulation Potential Information

2.2.5.1 Bioconcentration Factor—Freshwater, Salt Water

SCDM uses data from the following references for freshwater and salt water bioconcentration factors (BCF):

- Versar, Inc., 1989a, *Issue Paper: Bioaccumulation Potential Based on Ambient Water Quality Criteria Documents*, prepared for USEPA under contract no. 68-W8-0098.
- U. S. Environmental Protection Agency, 1992, Aquatic Information Retrieval (AQUIRE) Database, Environmental Research Laboratory, Duluth, MN.

SCDM contains the highest measured value from the Versar (1989a) document in preference to an estimated value from the same document. If no value is reported in Versar (1989a), the highest value from AQUIRE is used. All values where no environment is given but which list NaCl as a control are considered as fresh water values.

SCDM uses the highest value from the following aquatic organisms to establish Human Food Chain threat BCF values (this list includes only aquatic human food chain organisms in the cited references and is not meant to be a complete list of aquatic human food chain organisms):

- american or virginia oyster
- asiatic clam
- atlantic salmon
- atlantic silverside
- black mussel
- black bullhead
- black crappie
- blue crab
- bluegill
- brook trout
- brown trout
- channel catfish
- clam
- common bay mussel
- common mirror colored carp
- common shrimp
- crayfish
- dungeness or edible crab
- giant gourami
- gulf toadfish
- kiyi
- lake trout (siscowet)
- lake whitefish
- mangrove snapper
- manila littleneck clam
- mussel
- northern pike
- northern anchovy
- pilchard sardine
- pinfish
- pink salmon
- rainbow trout
- red swamp crayfish
- rock bass
- sauger
- shore crab
- spot
- striped bass
- striped mullet
- swan mussel
- tong sole
- topmouth gudgeon (golden shiner)
- white mullet
- white sand mussel
- winter flounder

Non-human food chain aquatic organisms are not used for the food chain BCF. The highest value from any aquatic organism mentioned in each reference is used to establish Environmental threat BCF values, using the same order of preference.

2.2.5.2 Partition Coefficient (Log K_{ow})

SCDM uses data from the following references for Log K_{ow} (also referred to as Log P) values:

- Versar, Inc., 1989b, *Impact of Variability in Log P Values on HRS Bioaccumulation Potential Scores Based on Peer-Reviewed Literature*, prepared for USEPA under contract no. 68-W8-0098.
- Syracuse Research Corporation, 1993, CHEMFATE database.
- GSC Corporation, 1990, CHEMEST database, developed for USEPA, Office of Pesticides and Toxic Substances.

SCDM prefers Versar values over CHEMFATE values. Within CHEMFATE, the recommended value is preferred. An estimated value is used if it is recommended and is greater than the measured value; otherwise, the measured value is used. If a recommended value is not available, SCDM uses the highest measured value. If there is more than one value measured at the same temperature and none is recommended, SCDM uses the highest value. If no conditions (e.g., temperature) were specified in CHEMFATE for all Log K_{ow} measurements for a substance, SCDM uses the highest value. For organic substances, if Versar and CHEMFATE do not contain a value, CHEMEST is used to estimate values.

2.2.6 Ecotoxicity Parameters

2.2.6.1 Acute and Chronic Freshwater Criteria

SCDM uses data from the following reference for acute and chronic freshwater criteria:

- U. S. Environmental Protection Agency, 1986b, *Quality Criteria for Water—1986*, Office of Water (EPA 440/5-86-001).

SCDM uses only values that are specifically stated as criteria. At this time, no Ambient Aquatic Life Advisory Concentrations (AALACs) have been specified.

2.2.6.2 Acute and Chronic Salt Water Criteria

SCDM uses data from the following reference for acute and chronic salt water criteria:

- U. S. Environmental Protection Agency, 1986b, *Quality Criteria for Water—1986*, Office of Water (EPA 440/5-86-001).

SCDM uses only values that are specifically stated as criteria. At this time, no AALACs have been specified.

2.2.6.3 LC₅₀—Freshwater, Salt Water

SCDM uses data from the following reference for freshwater and salt water LC₅₀ values:

- U. S. Environmental Protection Agency, 1993, Aquatic Information Retrieval (AQUIRE) database, Environmental Research Laboratory, Duluth, MN.

SCDM uses the lowest, acute LC₅₀ value found for any aquatic organism in the specified environment with an acute exposure duration of greater than one day and less than or equal to four days. All LC₅₀ values where no environment is given but which use NaCl as a control are considered as fresh water LC₅₀ values. When no durations and environments are given, LC₅₀ values are omitted from SCDM.

2.2.7 Benchmarks

The HRS assigns extra weight to targets with exposure levels to hazardous substances that are at or above benchmarks values. This section describes the sources for certain regulatory limits that the HRS uses as health-based or ecological-based benchmarks.

2.2.7.1 National Ambient Air Quality Standards (NAAQS)

SCDM uses data from the following reference for NAAQS:

- 40 CFR Part 50, 1978, National Ambient Air Quality Standards.

2.2.7.2 National Emissions Standards for Hazardous Air Pollutants (NESHAPS)

SCDM uses the following reference for NESHAPS:

- 40 CFR Part 61, 1985, National Emissions Standards for Hazardous Air Pollutants.

SCDM uses only values that are reported in ambient concentration units ($\mu\text{g}/\text{m}^3$).

2.2.7.3 Maximum Contaminant Levels (MCLs)

SCDM uses the following reference for MCLs:

- 40 CFR Part 141, 1993, National Primary Drinking Water Standards.

SCDM uses only MCLs that are reported in units of concentration (mg/L or $\mu\text{g}/\text{L}$). SCDM does not contain the MCLs for total trihalomethanes (0.10 mg/L of bromoform, bromodichloromethane, chloroform, plus dibromochloromethane), radium isotopes (5 pC/L of ^{226}Ra plus ^{228}Ra), gross alpha-particle activity (15 pC/L including ^{226}Ra but excluding uranium and radon), and beta-particle plus photon radioactivity (4 mrem/year). The action levels for lead and copper (56 FR 26560) are included.

2.2.7.4 Maximum Contaminant Level Goals (MCLGs)

SCDM uses the following reference for MCLGs:

- 40 CFR Part 141, 1993, National Primary Drinking Water Standards.

SCDM uses only non-zero MCLGs that are reported in units of concentration (mg/L or $\mu\text{g}/\text{L}$). For substances where multiple values are listed due to lack of consensus on appropriate carcinogen class, SCDM contains the lowest number. For substances where MCLs and MCLGs are reported but different, SCDM selects the MCLG as the lower of the two values (55 FR 51593).

2.2.7.5 FDA Action Level

SCDM uses the following reference for Food and Drug Administration Action Levels:

- U. S. Food and Drug Administration, 1987, *Action Levels for Poisonous or Deleterious Substances in Human and Animal Feed*, Center for Food Safety and Applied Nutrition.

SCDM contains FDA Action Levels for fish and shellfish only.

2.2.7.6 Uranium Mill Tailings Radiation Control Act (UMTRCA) Standards

SCDM uses the following reference for UMTRCA standards:

- 40 CFR 192 (1990), Uranium Mill Tailings Radiation Control Act Standards.

2.2.7.7 Ecological-Based Benchmarks

The Ambient Water Quality Criteria and the Ambient Aquatic Life Advisory Concentrations discussed in section 2.2.6 are also used to assign the ecological-based benchmarks.

2.3 CALCULATIONS IN SUPERFUND CHEMICAL DATA MATRIX

2.3.1 Volatilization Half-Life

SCDM estimates volatilization half-life in surface water for organic substances using CHEMEST method 1 (Thomas, 1982). In this method, the volatilization half-life ($\tau_{1/2}$) can be expressed as follows, where Z equals the mean water body depth in centimeters (cm) and K_L equals the overall liquid-phase mass transfer coefficient:

$$\tau_{1/2} = \frac{Z \cdot \ln 2}{K_L \text{ hr}} \quad [5]$$

The following expression gives the overall liquid-phase mass transfer coefficient, where H equals Henry's constant in $\text{atm}\cdot\text{m}^3/\text{mol}$, R equals the universal gas constant ($8.2 \times 10^{-5} \text{ atm}\cdot\text{m}^3/\text{mol}\cdot\text{K}$), T equals the temperature in K, k_g equals the gas-phase exchange coefficient, and k_l equals the liquid-phase exchange coefficient:

$$K_L = \frac{(H/RT)k_g k_l}{(H/RT)k_g + k_l} \quad \text{cm/hr} \quad [6]$$

The gas-phase exchange coefficient expression is dependent on the molecular weight (MW) of the compound. If MW is less than 65 g/mol, the following equation is used:

$$K_g = 3,000 \cdot (18/MW)^{1/2} \quad \text{cm/hr} \quad [7]$$

If MW is greater than or equal to 65 g/mol, the following equation is used, where V_{wind} equals the wind velocity in m/sec and V_{curr} equals the current velocity in m/sec:

$$K_g = 1137.5 \cdot (V_{wind} + V_{curr}) \cdot (18/MW)^{1/2} \text{ cm/hr} \quad [8]$$

The liquid-phase exchange coefficient expression is also dependent on the molecular weight of the compound. If MW is less than 65 g/mol, the following equation is used:

$$K_1 = 20 \cdot (44/MW)^{1/2} \text{ cm/hr} \quad [9]$$

If MW is greater than or equal to 65 g/mol, the expression also depends on the wind and current velocities; the following equation is used when V_{wind} is less than or equal to 1.9 m/sec and MW is greater than or equal to 65 g/mol:

$$K_1 = 23.51 \cdot (V_{curr}^{0.969}/Z^{0.673}) \cdot (32/MW)^{1/2} \text{ cm/hr} \quad [10]$$

The following equation is used when V_{wind} is greater than 1.9 m/sec and less than or equal to 5 m/sec, and MW is greater than or equal to 65 g/mol:

$$K_1 = 23.51 \cdot (V_{curr}^{0.969}/Z^{0.673}) \cdot (32/MW)^{1/2} e^{0.526(V_{wind}-1.9)} \text{ cm/hr} \quad [11]$$

No liquid-phase exchange coefficient equation is provided in Thomas (1982) for wind velocities greater than 5 m/sec.

Combining equations [5], [6], [7], and [9] into a single equation for estimating volatilization half-life ($\tau_{1/2}$) for compounds with MW less than 65 g/mol gives the following equation:

$$\tau_{1/2} = Z \cdot \ln 2 \cdot \{(1/20) \cdot (MW/44)^{1/2} + \{(RT/H \cdot 3000) \cdot (MW/18)^{1/2}\}\} \text{ hr} \quad [12]$$

The following equation, combining equations [5], [6], [8], and [10], can be used to estimate the volatilization half-life ($\tau_{1/2}$) for compounds with MW greater than or equal to 65 g/mol if the wind velocity is less than or equal to 1.9 m/sec:

$$\tau_{1/2} = Z \cdot \ln 2 \cdot \{ \{(Z^{0.673}/23.51 \cdot V_{curr}^{0.969}) \cdot (MW/32)^{1/2}\} + \{(RT/H \cdot 1137.5) \cdot [V_{wind} + V_{curr}] \cdot (MW/18)^{1/2}\} \} \text{ hr} \quad [13]$$

The following equation, combining equations [5], [6], [8], and [11], can be used to estimate the volatilization half-life ($\tau_{1/2}$) for compounds with MW greater than or equal to 65 g/mol if the wind velocity is greater than 1.9 m/sec and less than or equal to 5 m/sec:

$$\tau_{1/2} = Z \cdot \ln 2 \cdot \{ \{(Z^{0.673}/23.51 \cdot V_{curr}^{0.969}) \cdot (MW/32)^{1/2}\} e^{0.526(1.9-V_{wind})} + \{(RT/H \cdot 1137.5) \cdot [V_{wind} + V_{curr}] \cdot (MW/18)^{1/2}\} \} \text{ hr} \quad [14]$$

2.3.1.1 Volatilization Half-Life for Rivers, Oceans, Coastal Tidal Waters, and the Great Lakes

In order to calculate the volatilization half-life for rivers, oceans, coastal tidal waters, and the Great Lakes, the mean water body depth is taken as 100 cm, the temperature as 298 K, the wind velocity as 5 m/sec, and the current velocity as 1 m/sec. Using these values, equations [12] and [14] reduce to the following:

- MW less than 65 g/mol

$$\tau_{1/2} = 2.89 \cdot [0.05 \cdot (\text{MW}/44)^{1/2}] + \{(8.1 \times 10^{-6}/H) \cdot (\text{MW}/18)^{1/2}\} \text{ days} \quad [15]$$

- MW greater than or equal to 65 g/mol

$$\tau_{1/2} = 2.89 \cdot [0.185 \cdot (\text{MW}/32)^{1/2}] + \{(3.6 \times 10^{-6}/H) \cdot (\text{MW}/18)^{1/2}\} \text{ days} \quad [16]$$

where H is Henry's Law constant in $\text{atm} \cdot \text{m}^3/\text{mol}$ (chosen as described in Section 2.2.3.2) and MW is the molecular weight of the hazardous substance in g/mol.

2.3.1.2 Volatilization Half-Life for Lakes

In order to calculate the volatilization half-life for lakes, the mean water body depth is taken as 100 cm, the temperature as 298 K, the wind velocity as 0.5 m/sec, and the current velocity as 0.05 m/sec. Using these values, equations [12] and [13] reduce to the following:

- MW less than 65 g/mol

$$\tau_{1/2} = 2.89 \cdot [0.05 \cdot (\text{MW}/44)^{1/2}] + \{(8.1 \times 10^{-6}/H) \cdot (\text{MW}/18)^{1/2}\} \text{ days} \quad [17]$$

- MW greater than or equal to 65 g/mol

$$\tau_{1/2} = 2.89 \cdot [17.2 \cdot (\text{MW}/32)^{1/2}] + \{(3.9 \times 10^{-6}/H) \cdot (\text{MW}/18)^{1/2}\} \text{ days} \quad [18]$$

where H is Henry's Law constant in $\text{atm} \cdot \text{m}^3/\text{mol}$ (chosen as described in Section 2.2.3.2) and MW is the molecular weight of the hazardous substance in g/mol.

If H is less than $10^{-7} \text{ atm} \cdot \text{m}^3/\text{mol}$, the substance is less volatile than water and its concentration will increase as the water evaporates. The substance should be considered essentially nonvolatile (Thomas, 1982, p. 15-15); no volatilization half-life is estimated.

2.3.2 Distribution Coefficient (K_d)

For hazardous substances that are organic, the HRS assigns a mobility value based on the geometric mean of the upper and lower K_d range values where $K_d = K_{oc} \times f_s$, using f_s values of 0.03 and 0.77 to establish the upper and lower K_d values. The reference specified for K_d (CH₂M Hill, 1990) specifies that if no K_{oc} values are available, K_{oc} is taken as $0.63 \times K_{ow}$. Combining these relationships gives the following equation:

$$K_d = 0.09575 \times 10^{\log K_{ow}} \quad [19]$$

For any hazardous substance that is organic for which no K_d value is available in CH₂M Hill (1990) but with a Log K_{ow} value chosen as described in Section 2.2.5.2, SCDM calculates K_d using the equation [19].

2.3.3 Benchmarks

The HRS assigns extra weight to targets with exposure levels to hazardous substances that are at or above benchmarks values. In addition to the regulatory limits discussed in Section 2.2.7, the HRS uses

a number of benchmarks called screening concentrations. Screening concentrations correspond to a 10^{-6} individual cancer risk or an exposure level corresponding to an RfD under specified exposure assumptions. These assumptions, discussed below, are conservative, as well as broadly and easily applicable to sites nationwide. The Agency recognizes that modeling of human activity patterns would provide a more realistic determination of exposure or risk. While such information may be determined on a site-specific basis with considerable effort, it is difficult to develop assumptions on the activity patterns of target populations that could be applied to sites on a nationwide basis in order to develop exposure scenarios for the HRS. For this reason, the HRS exposure assumptions reflect values used for the assessment of risk throughout different programs within the Agency. EPA recognizes that a critical evaluation of the references cited below, along with other information, could lead to differing exposure assumptions. Moreover, this evaluation would indicate that the Agency is still refining the assumptions used in this area of risk assessment.

EPA also considered the limited number of samples available at the NPL listing stage when it selected these assumptions. As outlined in the Field Test of the proposed revised HRS, the Agency generally expects to have less than 100 samples for all pathways to support the HRS analysis. This limited sampling may miss areas of maximum contamination, or "hot spots," and thus the sample results may not represent the maximum level of contamination. Although the use of conservative exposure assumptions does not fully compensate for the limited data available for analysis, the use of less conservative assumptions would likely lead to a greater incidence of false negatives, *i.e.*, the Agency may not identify sites that should be investigated further under the remedial program.

For all the screening concentration benchmark calculations, it is assumed that an individual may be exposed for a period of 70 years. Recent assessments have recommended the adoption of an assumed exposure period of 30 years (USEPA, 1989c). Given the limitations discussed above, as well as the desire to maintain a simple procedure that is based on accepted methods, HRS screening concentrations assume 70 year lifetime exposures.

2.3.3.1 Screening Concentrations for the Ground Water Pathway and the Surface Water Pathway Drinking Water Threat

The following equation (USEPA, 1989c, p. 6-35) is used to calculate intake of a hazardous substance from ingestion of ground water or surface water used as drinking water:

$$\text{Intake (mg/kg/day)} = \frac{\text{CW} \times \text{IR} \times \text{EF} \times \text{ED}}{\text{BW} \times \text{AT}} \quad [20]$$

where:

CW = Contaminant Concentration in Water (mg/L)

IR = Ingestion Rate (L/day)

EF = Exposure Frequency (days/year)

ED = Exposure Duration (years)

BW = Body Weight (kg)

AT = Averaging Time (days)

Under the assumptions used for HRS purposes, the adult ingestion rate is 2 L/day, the exposure frequency for residents is daily (365 days/year), and the average adult body weight is 70 kg. The assumption of 2 L/day has been commonly employed by the Agency in most past assessments (c.f., USEPA, 1983). It is assumed that affected individuals will consume the water at this rate every day of the year. Refinements

in risk assessments sometimes assume that an individual will be away for vacations or that some water will be consumed at the workplace.

Cancer Risk Screening Concentration. The cancer risk screening concentration is obtained from the cancer potency factor, which is defined as follows:

$$\text{Probability of Cancer Response} = \text{Lifetime Average Intake} \cdot \text{Cancer Potency Factor} \quad [21]$$

A lifetime average intake requires setting the averaging time in equation [20] to 25,550 days (70 years). Combining equations [20] and [21] provides the concentration (SC_i) in water that corresponds to a 10^{-6} individual lifetime excess cancer risk for drinking water ingestion as follows:

$$SC_i = \frac{10^{-6} \times BW \times AT}{\text{Oral Cancer Potency Factor} \times IR \times EF \times ED}$$

Using the assumptions listed above with an averaging time of 25,550 days (for lifetime average intake) reduces equation [22] to the following:

$$SC_i (\text{mg/L}) = \frac{35.0 \times 10^{-6}}{\text{Oral Cancer Potency Factor} (\text{kg-day/mg})} \quad [23]$$

This equation is used to calculate SC_i for non-radioactive hazardous substances. Cancer potency factors for radionuclides are provided in pC_i^{-1} ; body weight and averaging time do not apply. Thus, the following equation for radionuclides corresponds to equation [22] for non-radionuclides:

$$SC_i = \frac{10^{-6}}{\text{Oral Cancer Potency Factor} \times IR \times EF \times ED} \quad [24]$$

Using the same exposure assumptions reduces equation [24] to the following equation for the concentration (SC_i) in water that corresponds to a 10^{-6} individual lifetime excess cancer risk for radionuclides for drinking water ingestion:

$$SC_i (\text{pC}_i/\text{L}) = \frac{1.957 \times 10^{-11}}{\text{Oral Cancer Potency Factor} (\text{pC}_i^{-1})} \quad [25]$$

Reference Dose Screening Intake Benchmark. A reference dose is an estimate of a daily exposure level of a substance to a human population below which adverse noncancer health effects are not anticipated. Setting the intake from ingestion of ground water or surface water used as drinking water equal to the oral reference dose (RfD_{oral}) and solving equation [20] for concentration gives the following equation:

$$CR_j = \frac{RfD_{\text{oral}} \times BW \times AT}{IR \times EF \times ED} \quad [26]$$

For non-carcinogenic effects, the averaging time is taken as equal to the period of exposure. Using the assumptions listed above reduces equation [26] to the following:

$$CR_j \text{ (mg/L)} = RfD_{\text{oral}} \text{ (mg/kg/day)} \times 35.0 \quad [27]$$

2.3.3.2 Screening Concentrations for the Surface Water Pathway Human Food Chain Threat

The following equation (USEPA, 1989c, p. 6-45) is used to calculate intake from fish and shellfish ingestion:

$$\text{Intake (mg/kg/day)} = \frac{CF \times IR \times FI \times EF \times ED}{BW \times AT} \quad [28]$$

where:

CF = Contaminant Concentration in Fish (mg/kg)
 IR = Ingestion Rate (kg/day)
 FI = Fraction Ingested from Contaminated Source (unitless)
 EF = Exposure Frequency (days/year)
 ED = Exposure Duration (years)
 BW = Body Weight (kg)
 AT = Averaging Time (days)

The value for ingestion rate is 0.054 kg/day (USDA, 1982), the fraction ingested is taken as 1.0 (corresponding to fishing exclusively in contaminated waters), the value for exposure frequency is 365 days/year, and the average adult body weight is 70 kg.

Cancer Risk Screening Concentration. Combining equations [21] and [28] provides the concentration (SC_i) that corresponds to a 10^{-6} individual lifetime excess cancer risk for fish and shellfish ingestion as follows:

$$SC_i = \frac{10^{-6} \times BW \times AT}{\text{Oral Cancer Potency Factor} \times IR \times FI \times EF \times ED} \quad [29]$$

Using the assumptions listed above with an averaging time of 25,550 days for carcinogenic effects reduces this equation to the following:

$$SC_i \text{ (mg/kg)} = \frac{0.00130}{\text{Oral Cancer Potency Factor(kg-day/mg)}} \quad [30]$$

Equation [30] is used to calculate SC_i for non-radioactive hazardous substances.

Using the above assumptions in equation [24] for the concentration (SC_i) that corresponds to a 10^{-6} individual lifetime excess cancer risk for radionuclide ingestion provides the following expression for ingestion of radionuclides in fish and shellfish:

$$SC_i \text{ (pC/kg)} = \frac{7.25 \times 10^{-10}}{\text{Oral Cancer Potency Factor (pC}^{-1})} \quad [31]$$

Reference Dose Screening Intake Benchmark. Setting the intake from fish and shellfish ingestion equal to the oral reference dose (RfD_{oral}) and solving equation [28] for concentration gives the following equation:

$$CR_j = \frac{RfD_{\text{oral}} \times BW \times AT}{IR \times FI \times EF \times ED} \quad [32]$$

For non-carcinogenic effects, the averaging time is taken as equal to the period of exposure. Using the assumptions listed above reduces equation [32] to the following:

$$CR_j \text{ (mg/kg)} = RfD_{\text{oral}} \text{ (mg/kg/day)} \times 1300 \quad [33]$$

2.3.3.3 Screening Concentrations for the Soil Exposure Pathway

The following equation (USEPA, 1989c, p. 6-40) is used to calculate intake from soil ingestion:

$$\text{Intake (mg/kg/day)} = \frac{CW \times IR \times CF \times FI \times EF \times ED}{BW \times AT} \quad [34]$$

where:

- CS = Contaminant Concentration in Soil (mg/kg)
- IR = Ingestion Rate (mg soil/day)
- CF = 10^{-6} kg/mg
- FI = Fraction Ingested from Contaminated Source (unitless)
- EF = Exposure Frequency (days/year)
- ED = Exposure Duration (years)
- BW = Body Weight (kg)
- AT = Averaging Time (days)

The value for ingestion rate is 200 mg/day for ages 6 years and younger and 100 mg/day for ages 7 years and older; this gives an average ingestion rate of soil over a lifetime of 120 mg/day. The fraction ingested is taken as 1.0 (corresponding to residing on contaminated soil), the exposure frequency is 365 days/year, and the body weight is 70 kg.

Cancer Risk Screening Concentration. Combining equations [21] and [34] provides the concentration (SC_i) that corresponds to a 10^{-6} individual lifetime excess cancer risk for soil ingestion as follows:

$$SC_i = \frac{10^{-6} \times BW \times AT}{\text{Oral Cancer Potency Factor} \times IR \times CF \times FI \times EF \times ED} \quad [35]$$

Using the assumptions listed above with an averaging time of 25,550 days for carcinogenic effects reduces this equation to the following:

$$SC_i \text{ (mg/L)} = \frac{0.583}{\text{Oral Cancer Potency Factor(kg-day/mg)}} \quad [36]$$

This equation is used to calculate SC_i for non-radioactive hazardous substances. Using the above assumptions in equation [24] for the concentration (SC_i) that corresponds to a 10^{-6} individual lifetime excess cancer risk for radionuclide ingestion provides the following expression for ingestion of radionuclides in soil:

$$SC_i \text{ (pC}_i/\text{L}) = \frac{3.26 \times 10^{-7}}{\text{Oral Cancer Potency Factor (pC}_i^{-1})} \quad [37]$$

Screening Concentration for External Radiation Exposures. The following equation (USEPA, 1991b, p. C-4) provides the concentration (SC_i) that corresponds to a 10^{-6} individual lifetime excess cancer risk for external radiation exposures from gamma-emitting radionuclides:

$$SC_i = \frac{10^{-6}}{\text{External Exposure Cancer Potency Factor} \times \text{ED}} \quad [38]$$

where

SD = Effective surface density of soil (kg/m^2)

ED = Exposure Duration (years)

Using an effective surface density of soil of $143 \text{ kg}/\text{m}^2$ and an exposure duration of 70 years in equation [37] provides the following expression:

$$SC_i \text{ (pC}_i/\text{kg}) = \frac{1.0 \times 10^{-10}}{\text{Cancer Potency Factor } (\text{m}^2/\text{pC}_i \cdot \text{yr})} \quad [39]$$

Reference Dose Screening Intake Benchmark. Setting the intake from soil ingestion equal to the oral reference dose (RfD_{oral}) and solving equation [34] for concentration gives the following equation:

$$CR_j = \frac{RfD_{oral} \times BW \times AT}{IR \times CF \times FI \times EF \times ED} \quad [40]$$

For non-carcinogenic effects, the averaging time is taken as equal to the period of exposure. Using the assumptions listed above reduces equation [40] to the following:

$$CR_j \text{ (mg/kg)} = RfD_{oral} \text{ (mg/kg/day)} \times 583,000 \quad [41]$$

2.3.3.4 Screening Concentrations for the Air Pathway

The following equation (USEPA, 1989c, p. 6-44) is used to calculate intake from inhalation of airborne hazardous substances:

$$\text{Intake (mg/kg/day)} = \frac{\text{CA} \times \text{IR} \times \text{ET} \times \text{EF} \times \text{ED}}{\text{BW} \times \text{AT}} \quad [42]$$

where:

- CA = Contaminant Concentration in Air (mg/m³)
- IR = Inhalation Rate (m³/hour)
- ET = Exposure Time (hours/day)
- EF = Exposure Frequency (days/year)
- ED = Exposure Duration (years)
- BW = Body Weight (kg)
- AT = Averaging Time (days)

The value for inhalation rate is 0.833 m³/hr (20 m³/day), the exposure time is 24 hours/day, the exposure frequency is 365 days/year, and the average adult body weight is 70 kg. Available references (c.f., USEPA, 1989c) recognize that other values may be applied to obtain an estimate of daily inhalation rates, but are not used in SCDM.

Cancer Risk Screening Concentration. Combining equations [21] and [42] provides the concentration (SC_i) that corresponds to a 10⁻⁶ individual lifetime excess cancer risk for inhalation as follows:

$$\text{SC}_i = \frac{10^{-6} \times \text{BW} \times \text{AT}}{\text{Inhalation Cancer Potency Factor} \times \text{IR} \times \text{ET} \times \text{EF} \times \text{ED}} \quad [43]$$

Using the assumptions listed above with an averaging time of 25,550 days for carcinogenic effects reduces this equation to the following:

$$\text{SC}_i (\text{mg/m}^3) = \frac{3.50 \times 10^{-6}}{\text{Inhalation Cancer Potency Factor(kg-day/mg)}} \quad [44]$$

This equation is used to calculate SC_i for non-radioactive hazardous substances. Using the above assumptions in equation [24] for the concentration (SC_i) that corresponds to a 10⁻⁶ individual lifetime excess cancer risk for radionuclide ingestion provides the following expression for inhalation of radionuclides:

$$\text{SC}_i (\text{pC}_i/\text{m}^3) = \frac{1.957 \times 10^{-12}}{\text{Oral Cancer Potency Factor (pC}_i^{-1}\text{)}} \quad [45]$$

Reference Dose Screening Intake Benchmark. Setting the inhalation intake equal to the inhalation reference dose (RfD_{inhalt}) and solving equation [42] for concentration gives the following equation:

$$\text{CR}_j = \frac{\text{RfD}_{\text{inhalt}} \times \text{BW} \times \text{AT}}{\text{IR} \times \text{ET} \times \text{EF} \times \text{ED}} \quad [46]$$

For non-carcinogenic effects, the averaging time is taken as equal to the period of exposure. Using the assumptions listed above reduces equation [46] to the following:

$$CR_j \text{ (mg/m}^3\text{)} = RfD_{\text{inhale}} \text{ (mg/kg/day)} \times 3.50 \quad [47]$$

3. CHEMICAL DATA, FACTOR VALUES, AND BENCHMARKS FOR HAZARDOUS SUBSTANCES

Appendix B-1 contains tables for non-radioactive hazardous substances. The first table in Appendix B-1 lists all of the factor values by pathway. The second table presents the benchmarks for the air and ground water pathways, the third table presents benchmarks for the surface water pathway, and the fourth table presents benchmarks for the soil exposure pathway. Appendix B-2 contains tables for radionuclides; the first table lists all of the factor values by pathway and the second table presents benchmarks for all pathways. Appendix C contains a cross reference index of hazardous substance names, synonyms and CAS numbers.

(by Synonym Name)

CAS Number	Synonym Name	SCDM Name
000092-87-5	(1,1'-biphenyl)-4,4'-diamine	Benzidine
000072-43-5	(2,2,2-trichloroethylidene)bis(4-methoxy-benzene), 1,1'-	Methoxychlor
000330-54-1	(3,4-Dichlorophenyl)-1,1-dimethylurea, 3-	Diuron
001116-54-7	(nitrosoimino) bis-ethanol, 2,2'-	Nitrosodiethanolamine, N-
000111-44-4	1,1'-oxybis(2-chloroethane)	Bis(2-chloroethyl)ether
000085-68-7	1,2-benzenedicarboxylic acid, butyl phenylmethyl ester	Butylbenzyl phthalate
000156-60-5	1,2-dichloroethylene	Dichloroethylene, trans-1,2-
000105-67-9	1-Hydroxy-2,4-dimethylbenzene	Dimethyl phenol, 2,4-
001746-01-6	2,3,7,8-Tetrachlorodibenzo-p-dioxin	TCDD
001563-66-2	2,3-dihydro-2,2-dimethyl-7-benzofuranol methylcarbamate	Carbofuran
000093-76-5	2,4,5-T	Trichlorophenoxyacetic acid, 2,4,5-
000094-75-7	2,4-D, acid	Dichlorophenoxyacetic acid, 2,4-
000094-82-6	2,4-DB	Butyric acid, 4-(2,4-dichlorophenoxy)
000606-20-2	2-Methyl-1,3-dinitrobenzene	Dinitrotoluene, 2,6-
000067-64-1	2-Propanone	Acetone
001689-84-5	3,4-dibromo-4-hydroxy-benzonitrile	Bromoxynil
000083-32-9	A	Acenaphthene
000083-32-9	Acenaphthylene, 1,2-dihydro	Acenaphthene
000141-78-6	Acetic acid, ethyl ester	Ethyl acetate
000108-05-4	Acetic acid, vinyl ester	Vinyl acetate
000062-38-4	acetoxyphenylmercury	Phenylmercuric acetate
000098-86-2	Acetylbenzene	Acetophenone
000079-34-5	Acetylene tetrachloride	Tetrachloroethane, 1,1,2,2-
000591-08-2	Acetylthiocarbamide, n-	Acetyl-2-thiourea, 1-
000060-57-1	Aldrin epoxide	Dieldrin
000319-84-6	alpha-BHC	Hexachlorocyclohexane, alpha-
012642-23-8	Aroclor 5442	Polychlorinated triphenyl
000110-86-1	Azobenzene	Pyridine
000542-62-1	Barium dicyanide	Barium cyanide
000050-32-8	Benz(a)pyrene	Benzo(a)pyrene
000056-55-3	Benzanthrene	Benz(a)anthracene
000584-84-9	Benzene, 2,4-diisocyanato-1-methyl-	Toluene diisocyanate
000062-53-3	Benzeneamine	Aniline

Synonyms List
(by Synonym Name)

CAS Number	Synonym Name	SCDM Name
000100-01-6	Benzeneamine, 4-nitro-	Nitroaniline, p-
000117-81-7	Benzenedicarboxylic acid, bis (2-ethylhexyl) ester, 1,2-	Bis (2-ethylhexyl) phthalate
000084-74-2	Benzenedicarboxylic acid, dibutyl ester, 1,2-	Di-n-butyl phthalate
000084-66-2	Benzenedicarboxylic acid, didecyl ester, 1,2-	Diethyl phthalate
000131-11-3	Benzenedicarboxylic acid, dimethyl ester, 1,2-	Dimethyl phthalate
000117-84-0	Benzenedicarboxylic acid, dioctyl ester, 1,2-	Di-n-octyl phthalate
000085-44-9	Benzenedicarboxylic anhydride, 1,2-	Phthalic anhydride
000108-46-3	Benzenediol, 1,3-	Resorcinol
000205-99-2	Benzo(b)fluoranthene	Benzofluoranthene, 3,4-
000129-00-0	Benzo(def)phenanthrene	Pyrene
000065-85-0	Benzoate	Benzoic acid
000218-01-9	Benzophenanthrene, 1,2-	Chrysene
000091-22-5	Benzopyridine	Quinoline
000098-88-4	Benzoyl chloride	Benzene carbonyl chloride
000319-85-7	beta-BHC	Hexachlorocyclohexane, beta-
000319-86-8	BHC-delta	Hexachlorocyclohexane, delta-
000092-52-4	Biphenyl	Biphenyl, 1,1-
000137-26-8	Bis(dimethylthiocarbamyl)disulfide	Thiram
000506-68-3	Bromcyanide	Cyanogen bromide
000075-25-2	Bromoform	Tribromomethane
000106-99-0	Butadiene	Butadiene, 1,3-
000093-80-1	Butanoic acid, 4-(2,4,5-trichlorophenoxy)-	TB, 2,4,5-
000078-93-3	Butanone	Methyl ethyl ketone
000071-36-3	Butyl alcohol	Butanol
000924-16-3	Butyl-n-nitroso-1-butanamine, n-	Nitroso-di-n-butylamine, N-
000630-10-4	Carbamidodiselenoic acid	Selenourea
000759-94-4	Carbamothioic acid, dipropyl-, s-ethyl ester	Ethyldipropylthiocarbamate, s-
000786-19-6	Carbofenthion	Carbophenothion
000075-44-5	Carbonic dichloride	Phosgene
000079-22-1	Carbonochloridic acid, methyl ester	Methyl chlorocarbonate
000143-50-0	Chlordecone	Kepone
008001-35-2	Chlorinated camphene	Toxaphene
000106-47-8	Chloro-benzeneamine, 4-	Chloroaniline, p-

Synonyms List
(by Synonym Name)

CAS Number	Synonym Name	SCDM Name
000059-50-7	Chloro-m-cresol, p-	Chloro-3-methylphenol, 4-
000076-44-8	Chlorochlordene, 3-	Heptachlor
000075-00-3	Chloroethane	Ethyl chloride
000075-01-4	Chloroethene	Vinyl chloride
000107-30-2	Chloromethoxy-methane	Chloromethyl methyl ether
000100-44-7	Chloromethyl benzene	Benzyl chloride
000091-58-7	Chloronaphthalene, beta-	Chloronaphthalene, 2-
000106-46-7	Chlorophenyl chloride, p-	Dichlorobenzene, 1,4-
000106-89-8	Chloropropylene oxide, 3-	Chloromethyloxirane, 2-
007440-47-3	Chrome	Chromium
000156-59-2	cis-dichloroethylene	Dichloroethylene, cis-1,2-
000071-43-2	Coal naptha	Benzene
000081-81-2	Coumafen	Warfarin
000056-72-4	Coumafos	Coumaphos
000544-92-3	Cuprous cyanide	Copper cyanide
000506-77-4	Cyanogen chloride	Chlorine cyanide
002385-85-5	Dechlorane	Mirex
000302-01-2	Diamine	Hydrazine
000119-90-4	Diamino-3,3-dimethoxybiphenyl, 4,4-	Dimethoxybenzidine, 3,3-
000053-70-3	Dibenz(a)anthracene, 1,2:5,6-	Dibenz(a,h)anthracene
000207-08-9	Dibenzo(bjk)fluorene	Benzo(k)fluoranthene
023950-58-5	Dichloro-N-(1,1-dimethylpropynyl)benzamide, 3,5-	Pronamide
000095-50-1	Dichlorobenzene, o-	Dichlorobenzene, 1,2-
000091-94-1	Dichlorobenzidine, o,o-	Dichlorobenzidine, 3,3-
000075-27-4	Dichlorobromomethane	Bromodichloromethane
000072-54-8	Dichlorodiphenyl dichloroethane	DDD
000072-55-9	Dichlorodiphenyl dichloroethylene, p,p-	DDE
000050-29-3	Dichlorodiphenyltrichloroethane, 4,4-	DDT
000075-35-4	Dichloroethylene, 1,1-	Dichloroethylene, 1,1-
000115-32-2	Dichlorokelthane	Dicofol
000075-09-2	Dichloromethane	Methylene chloride
000120-83-2	Dichlorophenol, 4,6-	Dichlorophenol, 2,4-
000542-75-6	Dichloropropylene, 1,3-	Dichloropropene, 1,3-

Synonyms List
(by Synonym Name)

CAS Number	Synonym Name	SCDM Name
000056-38-2	Diethyl 4-nitrophenyl phosphorothionate	Parathion, ethyl-
000060-29-7	Diethyl ether	Ethyl ether
000123-33-1	Dihydro-3,6-pyridazinedione, 1,2-	Maleic hydrazide
000108-38-3	Dimethyl benzene, 1,3-	Xylene, m-
000062-73-7	Dimethyl dichlorovinyl phosphate	Dichlorvos
000299-84-3	Dimethyl o-(2,4,5-trichlorophenyl)thiophosphate, o,o-	Ronnel
000298-00-0	Dimethyl p-nitrophenyl thiophosphate	Parathion, methyl-
000060-51-5	Dimethyl S-(N-methylcarbamoylmethyl) dithiophosphate, o,o-	Dimethoate
000106-42-3	Dimethylbenzene, 1,4-	Xylene, p-
000088-85-7	Dinitro-6-(1-methylpropyl) phenol, 2,4-	Dinoseb
000099-65-0	Dinitrobenzene, 1,2-	Dinitrobenzene, 1,3-
000132-64-9	Diphenylene Oxide	Dibenzofuran
000085-00-7	Diquat dibromide	Diquat
000075-15-0	Dithiocarbonic anhydride	Carbon disulfide
003689-24-5	Dithiofos	Tetraethylthiopyrophosphate
002921-88-2	Dursban	Chlorpyrifos
002104-64-5	EPN	Phosphorodithioc acid,phenyl-o-ethyl-o-(4-nitrophenyl)ester
000109-99-9	Epoxybutane, 1,4-	Tetrahydrofuran
001024-57-3	Epoxyheptachlor	Heptachlor epoxide
000107-21-1	Ethanediol, 1,2-	Ethylene glycol
016752-77-5	Ethanimidothioic acid, n-	Methomyl
000110-80-5	Ethoxy-ethanol, 2-	Ethylene glycol monoethyl ether
000075-07-0	Ethyl aldehyde	Acetaldehyde
002642-71-9	Ethyl guthion	Azinphos- ethyl
000055-18-5	Ethyl-n-nitroso-ethanamine, n-	Nitrosodiethylamine, N-
000107-06-2	Ethylene chloride	Dichloroethane, 1,2-
000106-93-4	Ethylene dibromide (EDB)	Dibromoethane, 1,2-
000151-56-4	Ethylenimine	Aziridine
000075-34-3	Ethyldene chloride	Dichloroethane, 1,1-
000206-44-0	Fluoranthenone	Benzo(j,k)fluorene
007782-41-4	Fluorine-19	Fluorine
000075-69-4	Freon 11	Trichlorofluoromethane
000076-13-1	Freon 113	Trichloro-1,2,2-Trifluoroethane, 1,1,2-

Synonyms List
(by Synonym Name)

CAS Number	Synonym Name	SCDM Name
000075-71-8	Freon 12	Dichlorodifluoromethane
000098-01-1	Furancarboxaldehyde, 2-	Furfural
000108-31-6	Furandione, 2,5-	Maleic anhydride
000058-89-9	Hexachlorocyclohexane- gamma	Lindane
000110-82-7	Hexahydrobenzene	Cyclohexane
000124-04-9	Hexanedioic acid	Adipic acid
000122-66-7	Hydrazodibenzene	Diphenylhydrazine, 1,2-
000057-12-5	Hydrocyanic acid	Cyanide
000074-90-8	Hydrocyanic acid	Hydrogen cyanide
007697-37-2	Hydrogen nitrate	Nitric acid
007803-51-2	Hydrogen phosphide	Phosphine
007783-06-4	Hydrosulfuric acid	Hydrogen sulfide
000051-28-5	Hydroxy-2,4-dinitrobenzene, 1-	Dinitrophenol, 2,4-
001689-83-4	Hydroxy-3,5-diiodo-benzonitrile, 4-	Ioxynil
000095-57-8	Hydroxychlorobenzene, 2-	Chlorophenol, 2-
000100-02-7	Hydroxynitrobenzene, 4-	Nitrophenol, 4-
000078-83-1	Isobutyl alcohol	Isobutanol
000064-18-6	Methanoic acid	Formic acid
001918-00-9	Methoxy-3,6-dichlorobenzoic acid, 2-	Dicamba
000067-56-1	Methyl alcohol	Methanol
000108-88-3	Methyl benzene	Toluene
000074-87-3	Methyl chloride	Chloromethane
000071-55-6	Methyl chloroform	Trichloroethane, 1,1,1-
000075-05-8	Methyl cyanide	Acetonitrile
000086-50-0	Methyl guthion	Azinphos- methyl
000108-39-4	Methyl phenol, 3-	Cresol, m-
000106-44-5	Methyl phenol, 4-	Cresol, p-
000118-96-7	Methyl-1,3,5-trinitrobenzene, 2-	Trinitrotoluene
000121-14-2	Methyl-2,4-dinitrobenzene, 1-	Dinitrotoluene, 2,4-
000108-10-1	Methyl-2-pentanone, 4-	Methyl isobutyl ketone
000126-98-7	Methyl-2-propanenitrile, 2-	Methacrylonitrile
000080-62-6	Methyl-2-propenoic acid, methyl ester, 2-	Methyl methacrylate
000062-75-9	Methyl-n-nitroso-methanamine, n-	Nitrosodimethylamine, N-

Synonyms List
(by Synonym Name)

CAS Number	Synonym Name	SCDM Name
000074-83-9	Methylbromide	Bromomethane
000063-25-2	Methylcarbamate-1-naphthalenol	Carbaryl
000101-14-4	Methylene bis (2-chloro-benzeneamine), 4,4'-	Methylene bis (2-chloroaniline), 4,4'-
000070-30-4	Methylene bis (3,4,6-trichlorophenol), 2,2-	Hexachlorophene
000050-00-0	Methylene oxide	Formaldehyde
000086-73-7	Methylenebiphenyl, 2,2-	Fluorene
000098-82-8	Methylethylbenzene, 1-	Cumene
000099-99-0	Methylnitrobenzene, p-	Nitrotoluene, 4-
000615-53-2	Methylnitroso-carbamic acid, ethyl ester	Nitroso-di-n-methylurethane, N-
000095-47-6	Methyltoluene, o-	Xylene, o-
007647-01-0	Muriatic acid	Hydrochloric acid
008001-58-9	Naphthalene oil	Creosote
000091-57-6	Naphthylamine	Methyl Napthalene, 2-
000096-12-8	Nemazon	Dibromo-3-chloropropane, 1,2-
000102-71-6	Nitrilotriethanol, 2,2,2-	Triethanolamine
000098-95-3	Nitrobenzol	Nitrobenzene
010102-43-9	Nitrogen oxide	Nitric oxide
010102-44-0	Nitrogen oxide	Nitrogen dioxide
000086-30-6	Nitrosophenylbenzeneamine, n-	Nitrosodiphenylamine, N-
000930-55-2	Nitrosopyrrolidine, 1-	Nitrosopyrrolidine, N-
000057-74-9	Octachloro-4,7-methanotetrahydroindane	Chlordane
000110-00-9	Oxacyclopentadiene	Furan
000460-19-5	Oxalonitrile	Cyanogen
000765-34-4	Oxiranecarboxaldehyde	Glycidylaldehyde
000542-88-1	Oxybis(chloromethane)	Bis(chloromethyl)ether
000111-46-6	Oxybis-ethanol, 2,2-	Diethylene glycol
000120-12-7	Paranaphthalene	Anthracene
012642-23-8	PCT	Polychlorinated triphenyl
000076-01-7	Pentalin	Pentachloroethane
000118-74-1	Perchlorobenzene	Hexachlorobenzene
000087-68-3	Perchlorobutadiene	Hexachlorobutadiene
000077-47-4	Perchlorocyclopentadiene	Hexachlorocyclopentadiene
000067-72-1	Perchloroethane	Hexachloroethane

000106-46-7	Dichlorobenzene, 1,4-	*-Chlorophenyl chloride, p-
000091-94-1	Dichlorobenzidine, 3,3-	*-Dichlorobenzidine, o,o-
000075-71-8	Dichlorodifluoromethane	*-Freon 12
000075-34-3	Dichloroethane, 1,1-	*-Ethyldene chloride
000107-06-2	Dichloroethane, 1,2-	*-Ethylene chloride
000075-35-4	Dichloroethene, 1,1-	*-Dichloroethylene, 1,1-
000156-59-2	Dichloroethylene, cis-1,2-	*-cis-dichloroethylene
000156-60-5	Dichloroethylene, trans-1,2-	*-1,2-dichloroethylene
000120-83-2	Dichlorophenol, 2,4-	*-Dichlorophenol, 4,6-
000094-75-7	Dichlorophenoxyacetic acid, 2,4-	*-2,4-D, acid
000078-87-5	Dichloropropane, 1,2-	*-Propylene chloride
000542-75-6	Dichloropropene, 1,3-	*-Dichloropropylene, 1,3-
000062-73-7	Dichlorvos	*-Dimethyl dichlorovinyl phosphate
000115-32-2	Dicofol	*-Dichloroketthane
000060-57-1	Dieldrin	*-Aldrin epoxide
000084-66-2	Diethyl phthalate	*-Benzene dicarboxylic acid, didecyl ester, 1,2-
000111-46-6	Diethylene glycol	*-Oxybis-ethanol, 2,2-
001445-75-6	Diisopropylmethyl-phosphonate	

Synonyms List
by SCDM Chemical Name

CAS Number	SCDM Name	Synonym Name
000060-51-5	Dimethoate	*-Dimethyl S-(N-methylcarbamoylmethyl) dithiophosphate, o,o-
000119-90-4	Dimethoxybenzidine, 3,3-	*-Diamino-3,3-dimethoxybiphenyl, 4,4-
000105-67-9	Dimethyl phenol, 2,4-	*-1-Hydroxy-2,4-dimethylbenzene
000131-11-3	Dimethyl phthalate	*-Benzenedicarboxylic acid, dimethyl ester, 1,2-
000077-78-1	Dimethyl sulfate	*-Sulfuric acid, dimethyl ester
000099-65-0	Dinitrobenzene, 1,3-	*-Dinitrobenzene, 1,2-
000051-28-5	Dinitrophenol, 2,4-	*-Hydroxy-2,4-dinitrobenzene, 1-
000121-14-2	Dinitrotoluene, 2,4-	*-Methyl-2,4-dinitrobenzene, 1-
000606-20-2	Dinitrotoluene, 2,6-	*-2-Methyl-1,3-dinitrobenzene
000088-85-7	Dinoseb	*-Dinitro-6-(1-methylpropyl) phenol, 2,4-
000123-91-1	Dioxane, 1,4-	*-Tetrahydro-1,4-dioxin
000078-34-2	Dioxathion	
000122-66-7	Diphenylhydrazine, 1,2-	*-Hydrazodibenzene
000085-00-7	Diquat	*-Diquat dibromide
000298-04-4	Disulfoton	
000330-54-1	Diuron	*-(3,4-Dichlorophenyl)-1,1-dimethylurea, 3-
000115-29-7	Endosulfan (I or II)	
0001031-07-8	Endosulfan sulfate	*-Thiodan sulfate
000145-73-3	Endothall	*-Phthalic acid, hexahydro-3,6-endo-oxy-
000072-20-8	Endrin	
007421-93-4	Endrin aldehyde	
000563-12-2	Ethion	*-Tetraethyl S,S'-methylenebisphosphorothioate, o,o,o',o'-
000141-78-6	Ethyl acetate	*-Acetic acid, ethyl ester
000100-41-4	Ethyl benzene	*-Phenylethane
000075-00-3	Ethyl chloride	*-Chloroethane
000060-29-7	Ethyl ether	*-Diethyl ether
000759-94-4	Ethyldipropylthiocarbamate, s-	*-Carbamothioic acid, dipropyl-, s-ethyl ester
000107-21-1	Ethylene glycol	*-Ethanediol, 1,2-
000110-80-5	Ethylene glycol monoethyl ether	*-Ethoxy-ethanol, 2-
000055-38-9	Fenethion	*-Phosphorothioic acid, o,o-dimethyl
007720-78-7	Ferrous sulfate	*-Sulfuric acid iron salt (1:1)
000086-73-7	Fluorene	*-Methylenebiphenyl, 2,2-
007782-41-4	Fluorine	*-Fluorine-19

000093-76-5	Trichlorophenoxyacetic acid, 2,4,5-	*-2,4,5-T
000096-18-4	Trichloropropane, 1,2,3-	
000102-71-6	Triethanolamine	*-Nitrilotriethanol, 2,2,2-
001582-09-8	Trifluralin	
000099-35-4	Trinitrobenzene, 1,3,5-	
000118-96-7	Trinitrotoluene	*-Methyl-1,3,5-trinitrobenzene, 2-
000126-72-7	Tris (2,3-dibromopropyl) phosphate	
010028-17-8	Tritium	
007440-61-1	Uranium	
013968-55-3	Uranium 233 (radionuclide)	
013966-29-5	Uranium 234 (radionuclide)	
015117-96-1	Uranium 235 (radionuclide)	
007440-61a1	Uranium 238 (radionuclide)	
007440-62-2	Vanadium	
001314-62-1	Vanadium pentoxide	--Vanadium oxide
000108-05-4	Vinyl acetate	*-Acetic acid, vinyl ester
000075-01-4	Vinyl chloride	*-Chloroethene
000081-81-2	Warfarin	*-Coumafen
000108-38-3	Xylene, m-	*-Dimethyl benzene, 1,3-
000095-47-6	Xylene, o-	*-Methyltoluene, o-
000106-42-3	Xylene, p-	--Dimethylbenzene, 1,4-
007440-66-6	Zinc	
000557-21-1	Zinc cyanide	
001314-84-7	Zinc phosphide	
007733-02-0	Zinc sulfate	*-Sulfuric acid, zinc salt
